X-ray

Infrared

Visible

Radio waves

Observations at different wavelengths reveal different aspects of astrophysics

Astronomy: how to look at the sky ?

Identify "messengers"

- "Messengers": particle/waves that carry information
- Need to know nature of these messengers:
 - Short-lived / long-lived ?
 - Obstructed by matter / pass through matter ?
 - Travel straight / change directions ?

Build detectors to detect messengers

- Optical telescopes for visible light
- Antennas for radio waves

Place detectors at appropriate locations

- Top of mountains, away from artificial light
- Outside the earth's atmosphere: on satellites / in space

Is light the only messenger ?

A trustworthy messenger: NEUTRINO (ν)

- Travels with (almost) the speed of light
- Travels in a straight line
- Brings information from deep within the stars (Not possible with light)

Is light the only messenger ?

A trustworthy messenger: NEUTRINO (ν)

- Travels with (almost) the speed of light
- Travels in a straight line
- Brings information from deep within the stars (Not possible with light)

What can we observe in neutrinos

Where do neutrinos come from ?

Particles that accompany radioactive β decay

Byproducts of almost all nuclear reactions

From the sun: 60 billion per cm² per second: During the day AND night

The second most abundant particles in the universe: 300 per cm³ even in empty space

- Cosmic microwave background: 400 photons/ cm³
- Cosmic neutrino background: 300 neutrinos / cm³

The most weakly interacting particles

- Do not interact with light \Rightarrow Invisible
- Stopping radiation with lead shielding:
 - Stopping α, β, γ radiation: 50 cm
 - Stopping neutrinos from the Sun: hundreds of light years !

(日) (日) (日) (日) (日) (日) (日)

• Advantage: Can observe deep inside stars

How do we observe them ?

- Build HUGE detectors: e.g. $100m \times 20m \times 20m$
- Wait for a looooong time: e.g. one neutrino per day

The most weakly interacting particles

- Do not interact with light \Rightarrow Invisible

The Standard Model of Particle Physics

- 3 neutrinos:
 ν_e, ν_μ, ν_τ
- chargeless
- spin 1/2
- almost massless

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Fermilab 95-759

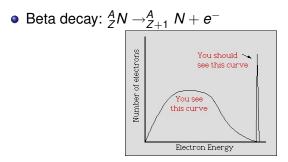

2 Brief history and open problems

- 3 What can we observe in neutrinos
- 4 How do we observe with neutrinos

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Neutrinos postulated but unobserved: 1932 - 1956

- In any two-body decay, energy of final products is fixed.
- ⇒ Electron should have a fixed energy
- Energy-momentum conservation in grave danger !!

A reluctant solution (Pauli): postulate a new particle

Electron neutrino ν_e : 1956

Reines-Cowan: Nobel prize 1995

• Reactor neutrinos: $\bar{\nu}_e + p \rightarrow n + e^+$

Muon neutrino ν_{μ} : 1962

Steinberger-Schwartz-Lederman: Nobel prize 1988

- Neutrinos from pion decay: $\pi^- \rightarrow \mu^- + \nu_{(\mu)}$
- $\nu_{(\mu)} + N \rightarrow N' + \mu^-$
- Always a muon, never an electron/positron

Tau neutrino ν_{τ} : 2000

DONUT experiment at Fermilab: $\nu_{\tau} + N \rightarrow \tau + N'$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Solar neutrino puzzle (1960s – 2002)

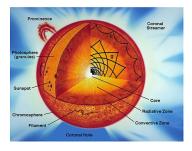

Missing electron neutrinos

- Nuclear fusion: mainly $4_1^1 \text{H} \rightarrow_2^4 \text{He} + 2e^+ + 2\nu_e$
- Neutrinos come millions of years before the light
- Only about half the expected number of v_e observed !

Solution to the solar neutrino puzzle (> 40 years)

- Neutrinos have nonzero mass and they mix with each other
- ν_e convert to ν_μ/ν_τ and hence are "lost"

Solar neutrino puzzle (1960s – 2002)

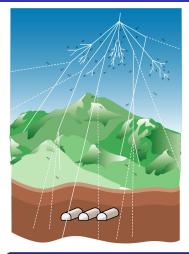

Missing electron neutrinos

- Nuclear fusion: mainly $4_1^1 H \rightarrow_2^4 He + 2e^+ + 2\nu_e$
- Neutrinos come millions of years before the light
- Only about half the expected number of v_e observed !

Solution to the solar neutrino puzzle (> 40 years)

- Neutrinos have nonzero mass and they mix with each other
- ν_e convert to ν_{μ}/ν_{τ} and hence are "lost"

Atmospheric neutrino puzzle (1980s - 1998)

Missing muon neutrinos

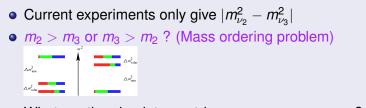

- Cosmic rays produce ν_e and ν_μ in the atmosphere
- All ν_e are detected as per expectations
- Up to half the ν_{μ} are lost when they travel through the Earth

Solution to the atmospheric neutrino puzzle (> 20 years)

- Neutrinos have nonzero mass and they mix with each other
- $\nu_{\mu} \rightarrow \nu_{\tau}$ and hence are "lost" (Neutrino oscillations)

Current status and open questions

ν_e, ν_μ, ν_τ mix among each other

What are the absolute neutrino masses m₁, m₂, m₃?

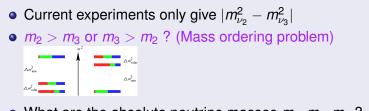

More open questions

- Are there more than 3 neutrinos ?
- Are neutrinos their own antiparticles ? ...
- Did neutrinos create more protons than antiprotons ?

(日) (字) (日) (日) (日)
